

Announcements

- Assignments:
 - Individual HW1 (came out Wed; due next Fri)
 - Group Project(-let) out! (due in 3 weeks)
- Suggested Datalog systems
 - DES Datalog
 - DLV Datalog
 - Later: LogiQL
- Next week:
 - Lectures Mon, **Wed 9am**, Wed 3:10pm
 - Discussion Fri 3:10pm

ECS-165B

Living in the family

```

brother_in_law(X,Y) <- [sister(X,Z), spouse(Z,Y)]. (1)
brother_in_law(X,Y) <- spouse(X,Z), [brother(Z,Y)]. (2)
sister_in_law(X,Y) <- [brother(X,Z), spouse(Z,Y)].
sister_in_law(X,Y) <- spouse(X,Z), [sister(Z,Y)].
uncle(X,Y) <- parent(X,Z), brother(Z,Y). (5)
uncle(X,Y) <- parent(X,Z), brother_in_law(Z,Y). (6)
aunt(X,Y) <- parent(X,Z), sister(Z,Y).
aunt(X,Y) <- parent(X,Z), sister_in_law(Z,Y).

```

uncle = parent . brother (5)
 | parent . brother_in_law (6)

Datalog Syntax

- A **relational database** is given as a set of **facts**:

```
employee(john, 40000, toys). ...
employee(mary, 65000, cs). ...
...
dept(cs, mary). ...
```

- A **Datalog program** defines **views** by means of **rules** of the form **Head** \leftarrow **Body**:
 $\text{boss}(\text{Emp}, \text{Mgr}) \leftarrow \text{employee}(\text{Emp}, \text{Salary}, \text{DeptNo}), \text{dept}(\text{DeptNo}, \text{Mgr})$
 $\text{highpaid}(\text{Emp}) \leftarrow \text{employee}(\text{Emp}, \text{Salary}, _), \text{Salary} > 60000$
- EDB**: extensionally defined relations (facts): employee/3, dept/2 *must not occur in any lhs*
- IDB**: intensionally (i.e., rule-) defined relations (views): boss/2 *must occur in some lhs*
- A **query** is a view with a distinguished **answer/n** relation:
 $\text{answer}(\text{Emp}, \text{Mgr}) \leftarrow \text{employee}(\text{Emp}, \text{Salary}, \text{DeptNo}), \text{dept}(\text{DeptNo}, \text{Mgr})$

Notation:

- lowercase**: **relation names** (employee/3, highpaid/1, ...) and **constants** (aka data values: john, toys, 50000, ...)
- UPPERCASE/Capitalized**: **variables** (Emp, X, ...) ("_" means: don't care)

Datalog: Variables are local to a rule

- What about these rules?

- $p(X, Y) :- q(X, Y, Z).$
 - $p(U, V) :- q(U, V, W).$
- Handwritten notes:*
 $p := \pi_{x,y}(q)$
 $p := \pi_{u,v}(q)$
 $p := \pi_{1,2}(q)$

- What is the equivalent RA (SQL) expression for (1) and (2)?

Handwritten notes:
 $p(x, y) :- q(x), r(x, z). \dots // \text{dom}(y)$ \leftarrow need to have sth like dom/1
 \uparrow unsafe
 $p(x, z) :- q(x), \text{not } r(x, y), s(x, z).$ $// \text{not } \pi(y, x, z)$
 \uparrow unsafe $//$ think of 'not p(...)' as a test!
 $\dots \text{not } r(x, -), \dots$

4

Datalog: Safety

- Safety:
 - every variable occurs positively in the body!
(why?)
 - ... more precisely, in a positive relational atom.
- In particular,
 - every head variable occurs positively in the body
 - every negated (body) variable occurs positively in the body

↪ the rule is then range-restricted (safe)

Datalog vs Relational Algebra

Relational operations have concise representations! Examples: $sel := \sigma_{x=a \wedge x \neq y}(p)$

<code>sel(X,Y) :- p(X,Y), X=a, not X=Y.</code>	% SELECT some tuples from p(X,Y)	
<code>proj(X) :- p(X,Y).</code>	% PROJECT on the first argument	$proj := \pi_x(p)$ $= \pi_{f_1}(p)$
<code>join(X,Y,Z) :- p(X,Y), q(Y,Z).</code>	% JOIN p(A,B), q(C,D) s.t. B=C	$join := p \bowtie_{f_2=f_1} q$
<code>prod(X,Y) :- p(X), q(Y).</code>	% PRODUCT of p(X) and q(Y)	$prod := p \times q$
<code>intersect(X) :- p(X), q(X).</code>	% INTERSECTION of p(X), q(X)	$intersect := p \cap q$
<code>diff(X) :- p(X), not q(X).</code>	% SET-DIFFERENCE: $p(X) \setminus q(X)$	$diff := p \setminus q$
<code>union(X) :- p(X).</code>	% UNION of p(X), ...	$union := p \cup q$
<code>union(X) :- q(X).</code>	% ... and q(X)	

Rules have a "logical reading" (i.e., rules are formulas):

$$\forall X (diff(X) \leftarrow p(X) \wedge \neg q(X)).$$

$$\forall X (union(X) \leftarrow p(X) \vee q(X)).$$

Living in the family: Rule-Goal Graph

```

1 parent(X,Y) ← father(X,Y).
2 parent(X,Y) ← mother(X,Y).

3 son(X,Y)    ← parent(Y,X), male(Y).
4 daughter(X,Y) ← parent(Y,X), female(Y).

5 brother(X,Y) ← parent(X,Z), son(Z,Y), X \= Y.
6 sister(X,Y)  ← parent(X,Z), daughter(Z,Y), X \= Y.

```

ECS-165B

7

Datalog: Rule-Goal Graph (cont'd)

```

grandparent(X, Y) :-
  parent(X, Z), parent(Z, Y).
father(X, Y) :-
  parent(X, Y), male(X).
mother(X, Y) :-
  parent(X, Y), female(X).
brother(X, Y) :-
  parent(P, X), parent(P, Y), male(X), X != Y.
sister(X, Y) :-
  parent(P, X), parent(P, Y), female(X), X != Y.

```

```

1 ancestor(X, Y) :- parent(X, Y).
2 ancestor(X, Y) :- parent(X, Z), ancestor(Z, Y).

```

anc := parent
 Repeat
 anc := parent Δ anc
 #2=#1
 Until no change
